EXPERIMENT – 12

INSTALLATION OF TYPE-2 HYPERVISOR

AIM

To install and explore a Type-2 hypervisor (VMware Workstation) on a host operating system and use it to create and manage virtual machines.

REQUIREMENTS

1. A computer with Windows operating system.
2. VMware Workstation installed on the computer.
3. Sufficient RAM and disk space for virtual machines.

PROCEDURE

1. Start the host computer and log in to Windows.

2. Open VMware Workstation from the desktop shortcut or Start menu.

3. Observe the Home screen and the available options.

4. Select **Create a New Virtual Machine** to begin creating a virtual machine, or select **Open a Virtual Machine** to open an existing one.

5. Configure the virtual machine hardware and attach the required operating-system ISO file when creating a new VM.

6. Start the virtual machine and follow the guest operating-system installation steps.

7. Verify that the virtual machine appears in VMware Workstation and can be opened or resumed.

IMPLEMENTATION INPUT

VMware Workstation application opened on the Windows host computer.

OUTPUT

The VMware Workstation Home screen is displayed successfully with options to create a new virtual machine, open a virtual machine, and connect to a remote server.

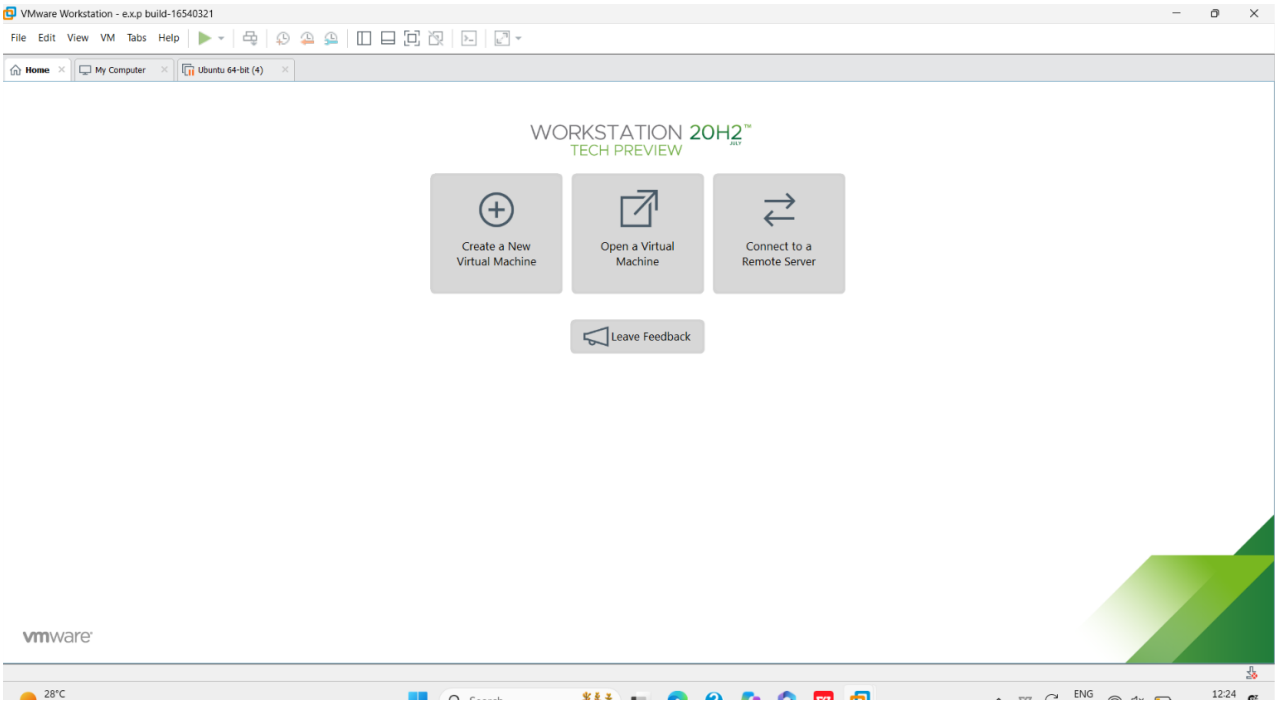

Figure 1: VMware Workstation Home screen (actual screenshot).

RESULT

VMware Workstation, a Type-2 hypervisor, was opened successfully and its virtual-machine management options were verified.
