EXPERIMENT – 15

CREATE A SNAPSHOT OF A VM AND TEST IT BY LOADING THE PREVIOUS VERSION

Aim

To create a snapshot of a virtual machine in VMware Workstation and restore the VM to a saved state.

Requirements

Computer with VMware Workstation and a configured virtual machine with a guest operating system installed.

Procedure

1. Open VMware Workstation and select the installed virtual machine.
2. Power on the VM and make a small test change in the guest operating system if needed.
3. Select the VM and open **VM** → **Snapshot** → **Take Snapshot**.
4. Enter a descriptive snapshot name and description, then confirm creation.
5. Make a further test change so the snapshot can be tested.
6. Open **Snapshot Manager** and select the snapshot to restore.
7. Click **Go To** (or the equivalent restore option) and confirm.
8. Start or inspect the VM and verify that it has returned to the selected saved state.

Implementation Input

A configured Ubuntu 64-bit virtual machine in VMware Workstation with snapshots available in Snapshot Manager.

OUTPUT

Actual VMware Workstation Snapshot Manager screenshot supplied for this experiment.

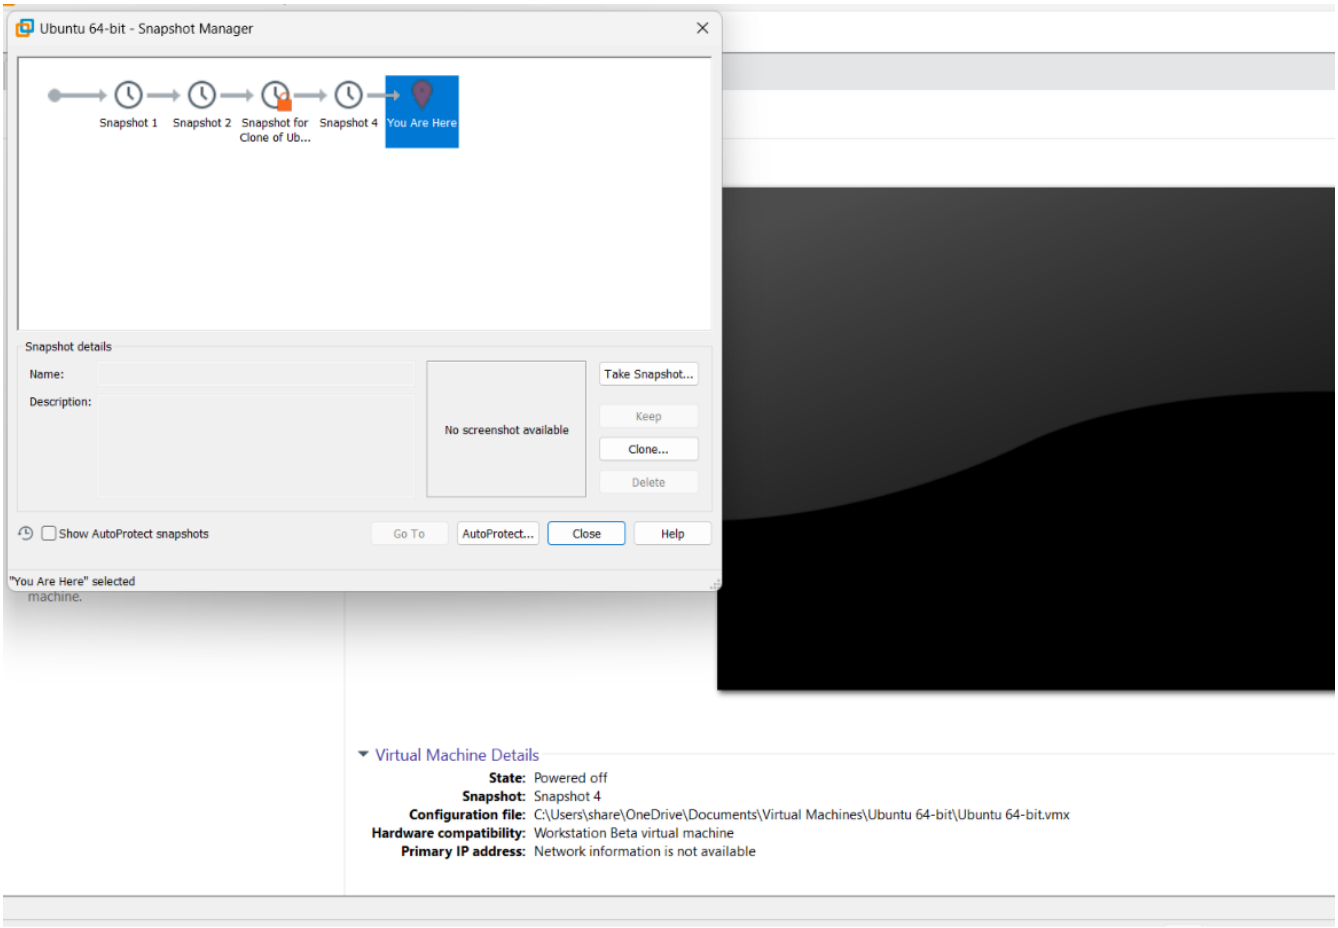

Figure 1: Snapshot Manager displays multiple snapshots and the current “You Are Here” state. The VM details indicate that the virtual machine is powered off and currently associated with Snapshot 4.

Result

The Snapshot Manager was opened successfully and the saved snapshot history is visible. The supplied screenshot documents the snapshot-management stage. To demonstrate a complete restore test, select a previous snapshot, use Go To, and capture the confirmation or resulting VM state.
